

CLEMCO APOLLO 20 AND 60 SUPPLIED-AIR RESPIRATOR SUSPENSION

REPLACEMENT & ADJUSTMENT

WARNING

The suspension maintains a fixed distance between the head and the helmet. It is critical to properly install and adjust the suspension. Adjust as described, to provide maximum head protection and comfort.

1. Remove the cape from the helmet.
2. Remove and discard the old suspension and suspension strap by extracting the plastic tabs from the wedge-shaped clefts in the shell.
3. Unfasten the vinyl sweatband from the two lower, outside buttons (A and B).
4. The suspension fits head sizes 6.5 to 8. Head sizes are marked on the headband slots. Slide the headband tongue through the front holder until the desired head size is reached. It is important that the adjustment be made evenly on both sides. Press the selected slots firmly onto the lugs on the front band.
5. Fasten the vinyl sweatband onto the buttons of the suspension.
6. Install the suspension strap before installing the suspension. Insert the yellow end tabs into the clefts on the helmet shell. When correctly installed the strap is between the suspension and the helmet shell and above the ears.
7. Install the suspension by inserting the four white plastic tabs into the clefts on the shell. The tabs must fully seat in their respective locators.
8. Try the helmet on for fit and readjust if necessary.
9. Make sure the chin strap is in place, then reattach the cape onto the helmet following the instructions in the manual.
